

Powering Innovation That Drives Human Advancement

TwinFlow JIP Proposal

Callum Williams-York

Introduction - Problem

- Floating wind is expected to take off from a standing start
- Assets in the field will need to be maintained with detailed inspection and monitoring often expensive
- Digital twins can optimise maintenance schedules and extend operation life
- Analysis methods for floating offshore wind are advancing rapidly but remain unvalidated
- There are a wide variety of floating platforms with challenging hydrodynamic and stability characteristics to simulate

TwinFlow - JIP Proposal

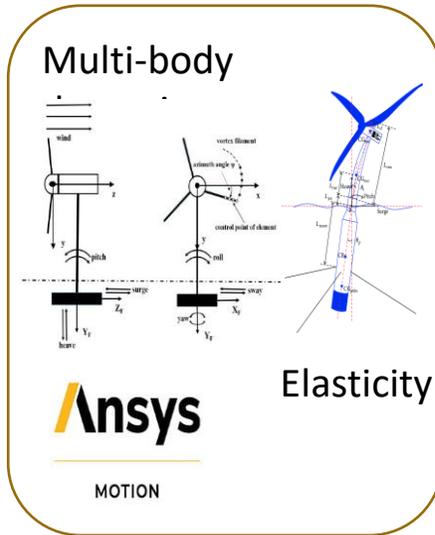

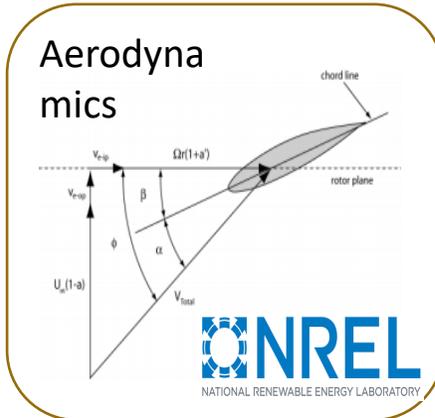

- The term "digital twin" often sparks confusion
- Our JIP's interpretation of a digital twin goes beyond these idea:
 - Dynamic representation of both the full FOWT and its environment
 - Designed to mirror real-world performance
 - Adapt over time.
- Our proposed digital twin, combined with a set of clear guidelines, will create a reusable, adaptable framework for future floating offshore wind projects.
- Built using ANSYS and other commercially available tools, this standardised workflow will ensure consistency and efficiency, with minimal need for customisation, across a range of applications.

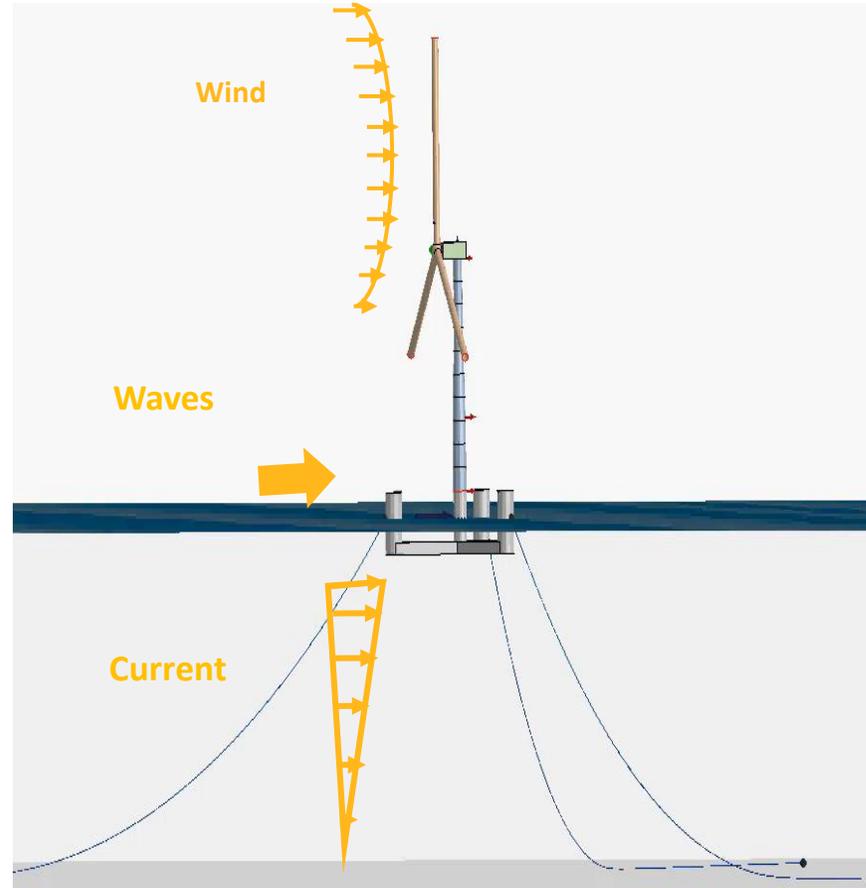

Solution – Simulation Driven Digital Twin

Simulation

High-fidelity accurate simulation of FOWT

Aero-Hydro-Elastic Coupling System

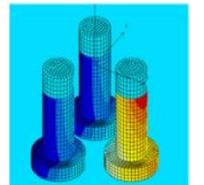

Ansys
Mechanical

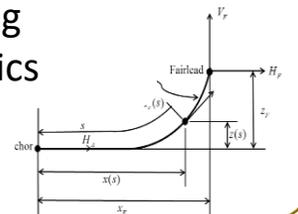

Detailed Structural Analysis
Fatigue

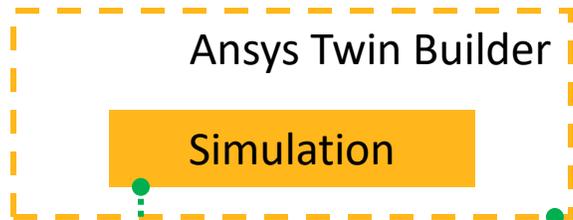

Hydrodynamics

Mooring Dynamics

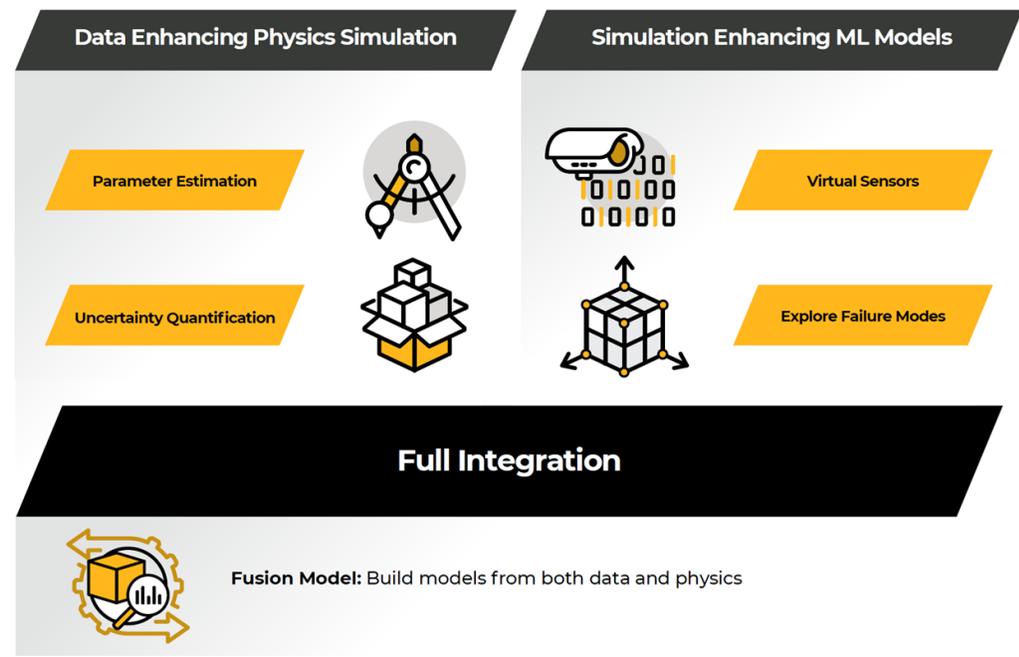

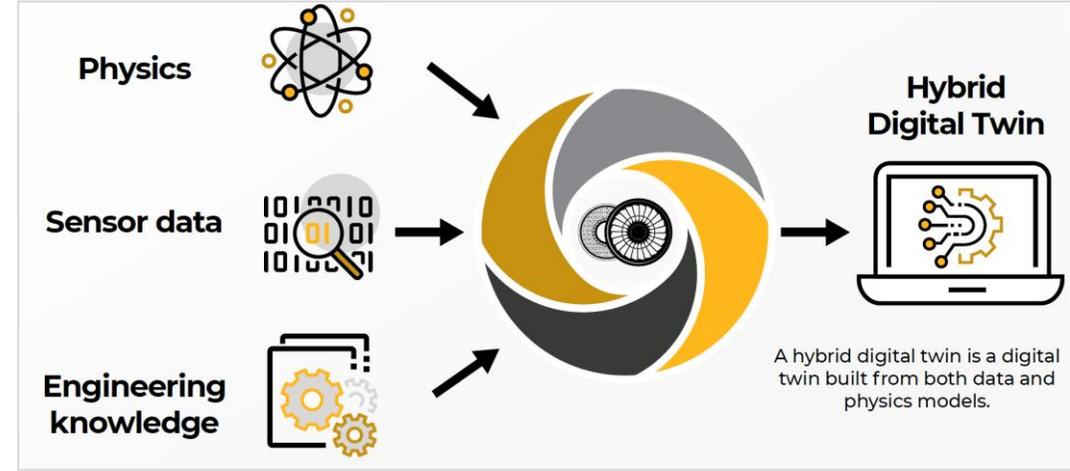

Solution – Simulation Driven Digital Twin

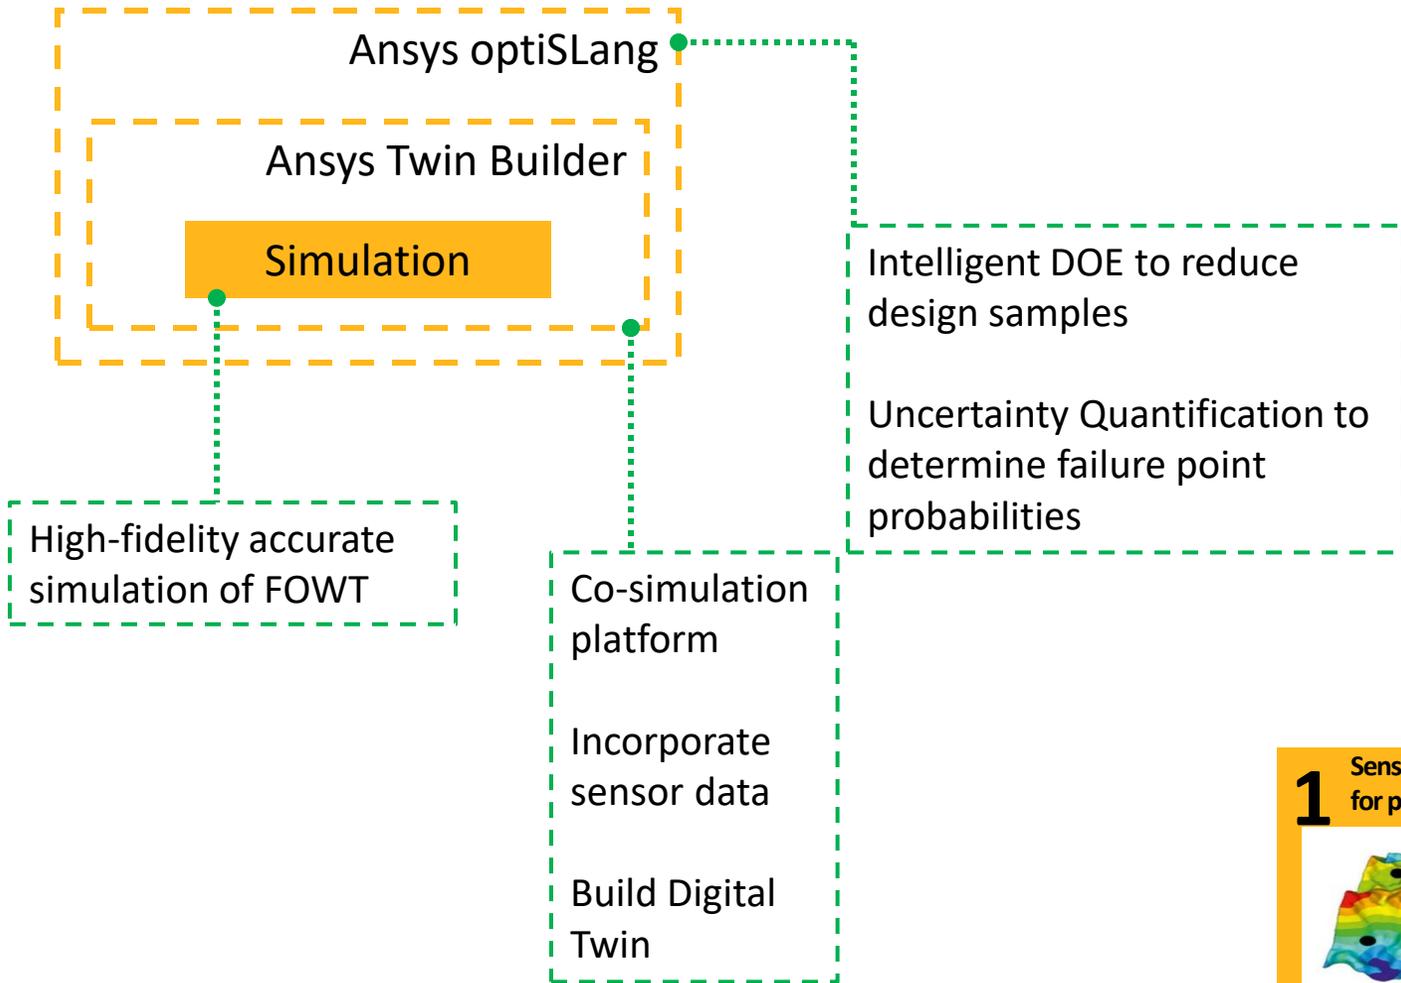

High-fidelity accurate simulation of FOWT

Co-simulation platform
Incorporate sensor data
Build Digital Twin

Solution – Simulation Driven Digital Twin

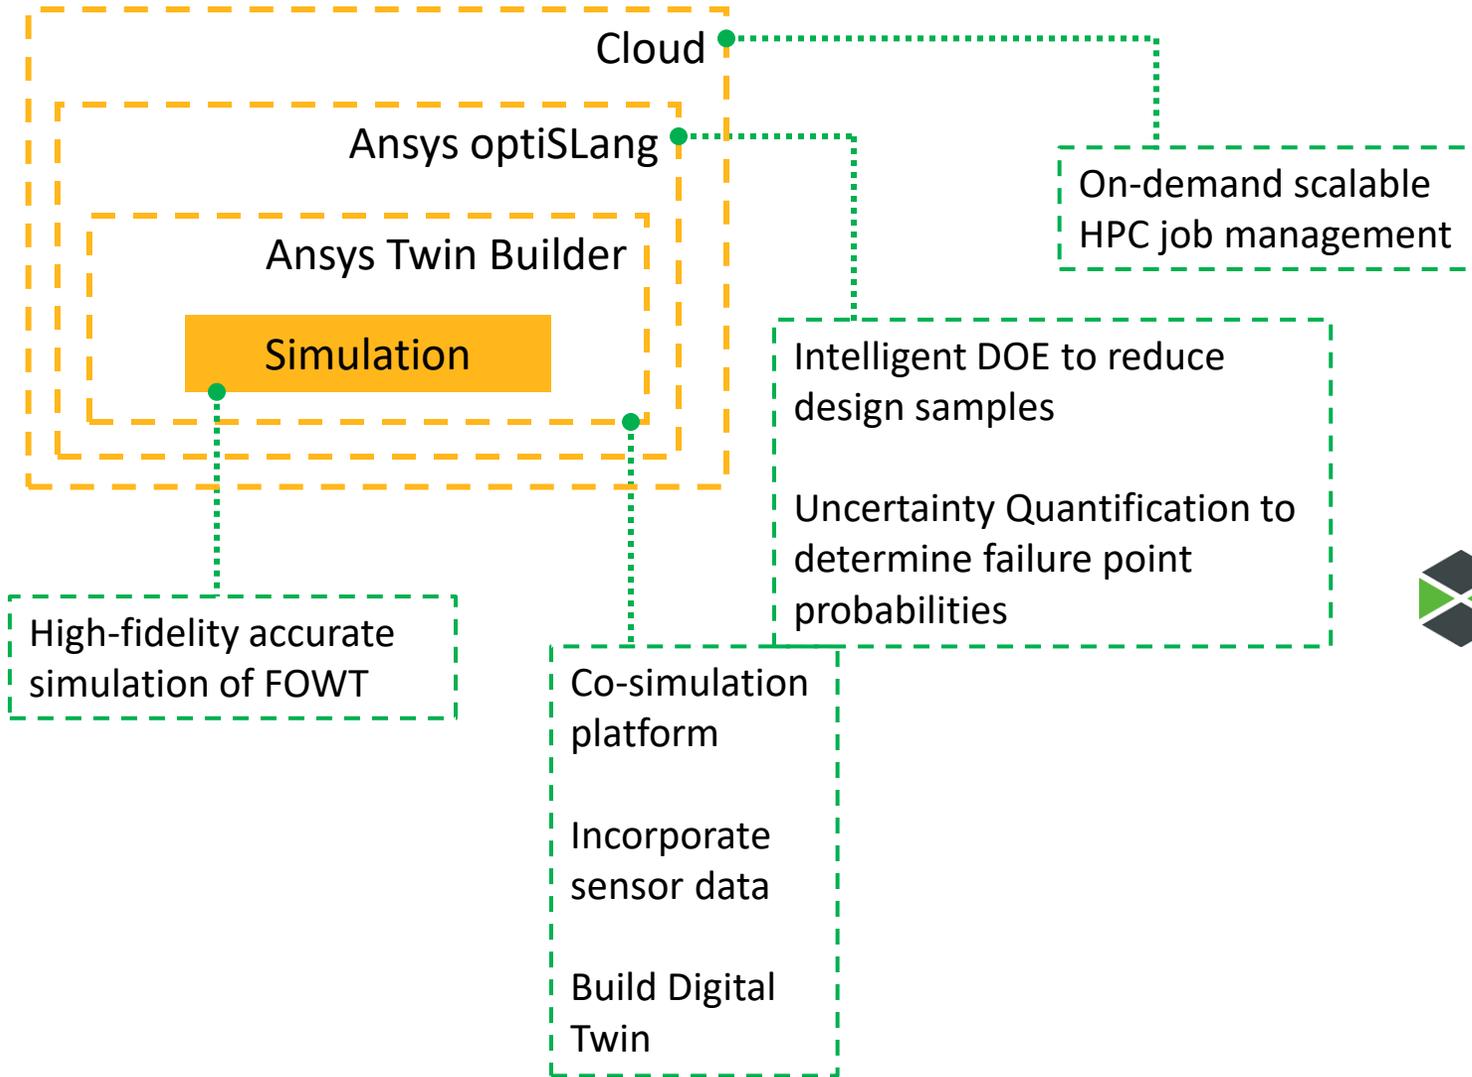

1 Sensitivity analysis for pre-optimization

2 Optimization using MOP

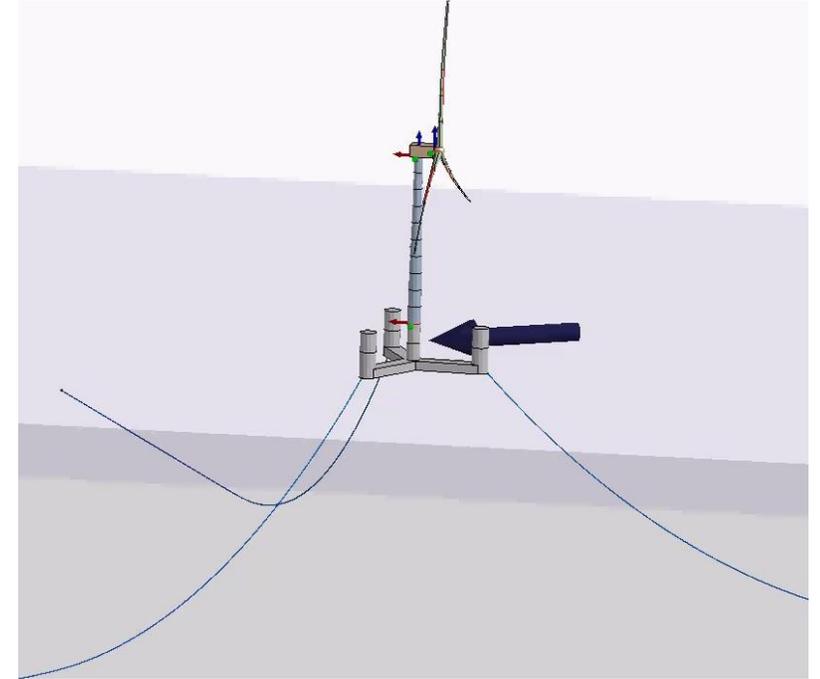

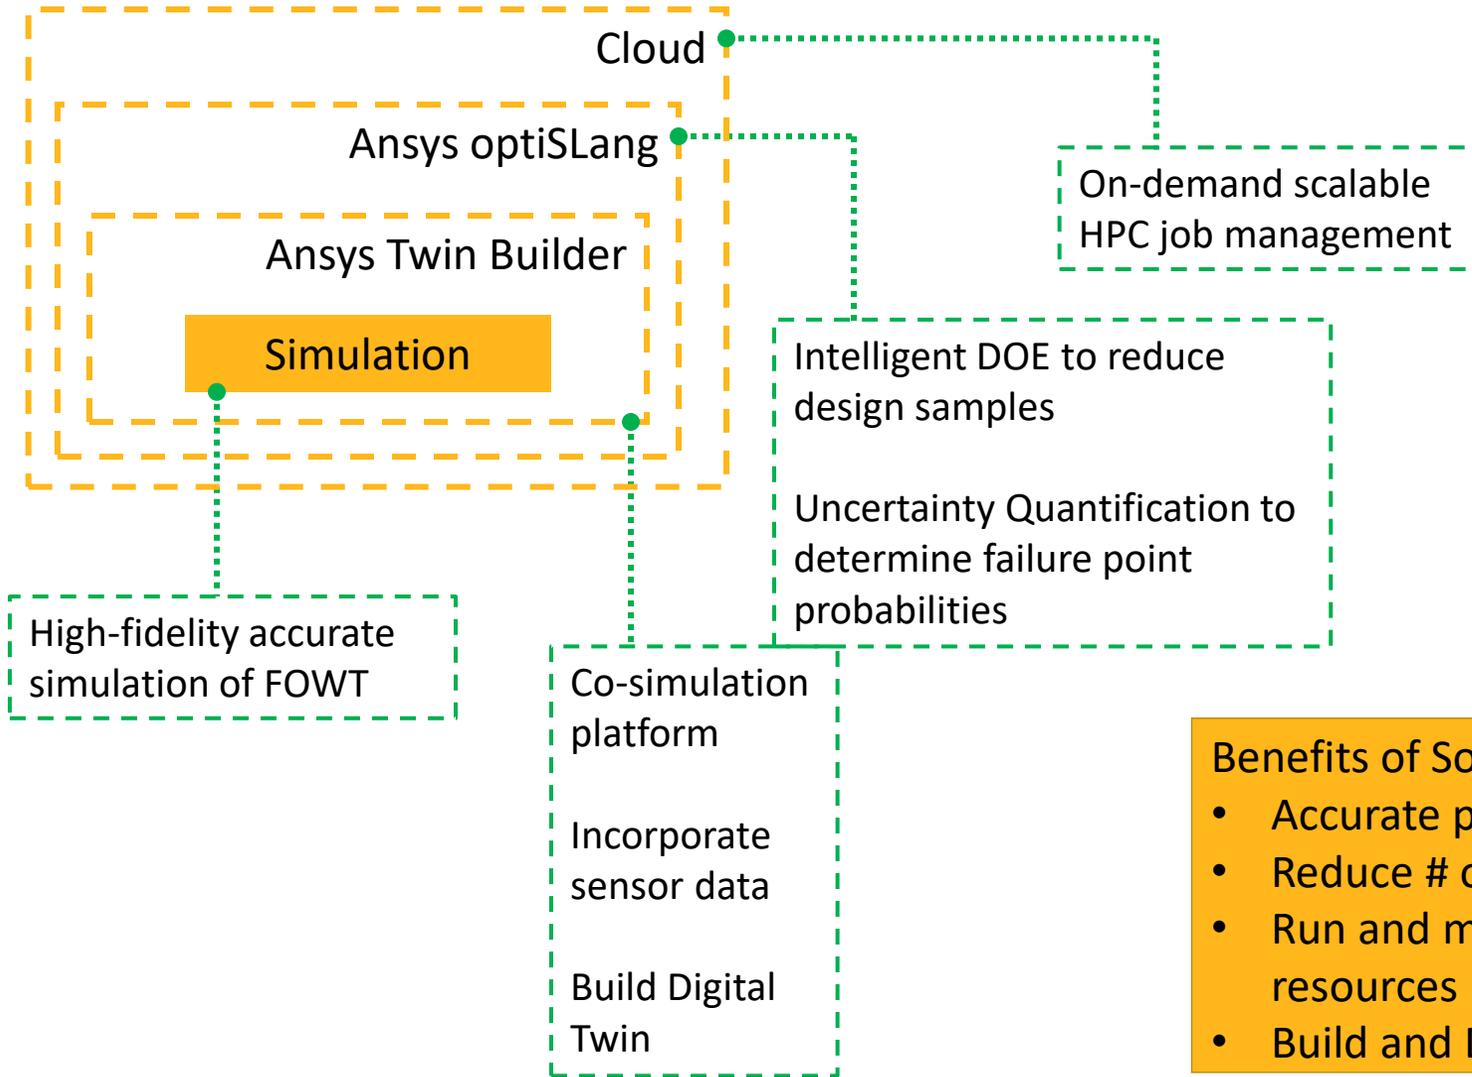

3 Direct optimization with algorithms

- ✓ NLPQL
- ✓ ARSM
- ✓ Simplex
- ✓ EA
- ✓ PSO

Solution – Simulation Driven Digital Twin

Solution – Simulation Driven Digital Twin

- Benefits of Solution:**
- Accurate physics models
 - Reduce # of simulations by using ROMs and AI.
 - Run and manage large simulations w/ off-prem compute resources
 - Build and Deploy Digital Twins.

JIP Proposal

Key benefits for partners and sponsors:

- **Verification of Existing Design Analysis**: Validate floating wind turbine design against real-world data, improving accuracy and reliability.
- **Optimise the use of monitoring technology**: Identify which type of sensors provide value and where to place them.
- **Enhanced Maintenance Strategies**: Use real-time monitoring and predictive insights to minimise downtime and optimise maintenance schedules.
- **Extended Asset Lifespan**: Track fatigue and wear to extend the operational life of platforms, moorings, and cables.
- **Optimised Design and Material Savings**: Reduce over-conservatism in structural designs, cutting steel weight and overall project costs.
- **Scalable and Flexible Solutions**: Adapt the digital twin framework for various floating designs, locations, and future larger turbines.
